

# Introduction to iterators

PYTHON DATA SCIENCE TOOLBOX (PART 2)

**Hugo Bowne-Anderson**  
Data Scientist at DataCamp

# Iterating with a for loop

- We can iterate over a list using a for loop

```
employees = ['Nick', 'Lore', 'Hugo']
for employee in employees:
    print(employee)
```

```
Nick
Lore
Hugo
```

# Iterating with a for loop

- We can iterate over a string using a for loop

```
for letter in 'DataCamp':  
    print(letter)
```

```
D  
a  
t  
a  
c  
a  
m  
p
```

# Iterating with a for loop

- We can iterate over a range object using a for loop

```
for i in range(4):  
    print(i)
```

```
0  
1  
2  
3
```

# Iterators vs. iterables

- Iterable → OBJECT
  - Examples: lists, strings, dictionaries, file connections ?
  - An object with an associated `iter()` method
  - Applying `iter()` to an iterable creates an iterator
- Iterator → IS ALSO AN OBJECT THAT KEEPS STATE AND PRODUCES THE NEXT VALUE WHEN WE CALL `next()`
  - Produces next value with `next()`

# Iterating over iterables: next()

```
1 word = 'Da'  
it = iter(word)  
next(it)
```

'D'

```
2 next(it)
```

'a'

```
3 next(it)
```

```
StopIteration          Traceback (most recent call last)  
<ipython-input-11-2cdb14c0d4d6> in <module>()  
-> 1 next(it)  
StopIteration:
```

# Iterating at once with SPLAT OPERATION

```
{ word = 'Data'  
it = iter(word)  
print(*it)
```

Data

```
print(*it) WHEN ITERATION IS OVER WE CAN'T CONTINUE  
WE SHOULD DEFINE AN OTHER ITERATOR OR AN ITERABLE
```

- No more values to go through!

# Iterating over dictionaries

```
pythonistas = {'hugo': 'bowne-anderson', 'francis': 'castro'}  
for key, value in pythonistas.items():  
    print(key, value)
```

```
francis castro  
hugo bowne-anderson
```

TO ITERATE OVER A KEY-VALUE PAIRS OF A PYTHON DICTIONARY, WE NEED TO UNPACK THEM

( APPLY .ITEMS() METHOD )

# Iterating over file connections

```
file = open('file.txt')      # READ ROW OF TXT FILE  
it = iter(file)  
print(next(it))
```

This is the first line.

```
print(next(it))
```

This is the second line.

# **Let's practice!**

**PYTHON DATA SCIENCE TOOLBOX (PART 2)**

# Playing with iterators

PYTHON DATA SCIENCE TOOLBOX (PART 2)

**Hugo Bowne-Anderson**  
Data Scientist at DataCamp

# Using enumerate()

TAKES ANY ITERABLE AS ARGUMENT

```
avengers = ['hawkeye', 'iron man', 'thor', 'quicksilver']
```

```
e = enumerate(avengers)
```

```
print(type(e))
```

ENUMERATES  
OBJECT

```
<class 'enumerate'>
```

→ CONSISTS OF PAIRS CONTAINING ELEMENTS OF THE ORIGINAL  
ITERABLE, ALONG WITH THEIR INDEX

```
e_list = list(e)
```

```
print(e_list)
```

LIST OF TUPLES

```
[(0, 'hawkeye'), (1, 'iron man'), (2, 'thor'), (3, 'quicksilver')]
```

# enumerate() and unpack

THE ENUMERATE OBJECT  
IS ALSO AN ITERABLE

```
avengers = ['hawkeye', 'iron man', 'thor', 'quicksilver']
for index, value in enumerate(avengers):
    print(index, value)
```

```
0 hawkeye
1 iron man
2 thor
3 quicksilver
```

```
for index, value in enumerate(avengers, start=10):
    print(index, value)
```

```
10 hawkeye
11 iron man
12 thor
13 quicksilver
```

IT STARTS ENUMERATING FROM  $\phi$  AS FIRST ELEMENT  
BUT WE CAN ALTER IT

# Using zip()

ACCEPTS AN ARBITRARY NUMBER OF ITERABLES  
AN RETURNS AN ITERATION OF TUPLES

```
avengers = ['hawkeye', 'iron man', 'thor', 'quicksilver']
names = ['barton', 'stark', 'odinson', 'maximoff']
z = zip(avengers, names)
print(type(z))
```

```
<class 'zip'>
```

```
z_list = list(z)
print(z_list)
```

```
[('hawkeye', 'barton'), ('iron man', 'stark'),
('thor', 'odinson'), ('quicksilver', 'maximoff')]
```

TO OBTAIN THE TUPLES ELEMENTS WE CAN USE

- 1) LIST()
- 2) FOR LOOP
- 3) SPLAT OPERATOR

# zip() and unpack

```
avengers = ['hawkeye', 'iron man', 'thor', 'quicksilver']
names = ['barton', 'stark', 'odinson', 'maximoff']
for z1, z2 in zip(avengers, names):
    print(z1, z2)
```

```
hawkeye barton
iron man stark
thor odinson
quicksilver maximoff
```

UNZIP

$z = \text{ZIP}(\text{AVENGERS}, \text{NAMES})$

$z_1, z_2 = \text{ZIP}(*z)$

# Print zip with \*

```
avengers = ['hawkeye', 'iron man', 'thor', 'quicksilver']
names = ['barton', 'stark', 'odinson', 'maximoff']
z = zip(avengers, names)
print(*z)
```

```
('hawkeye', 'barton') ('iron man', 'stark')
('thor', 'odinson') ('quicksilver', 'maximoff')
```

# **Let's practice!**

**PYTHON DATA SCIENCE TOOLBOX (PART 2)**

# Using iterators to load large files into memory

PYTHON DATA SCIENCE TOOLBOX (PART 2)

Hugo Bowne-Anderson  
Data Scientist at DataCamp

# Loading data in chunks

- There can be too much data to hold in memory
- Solution: load data in chunks!
- Pandas function: `read_csv()`
  - Specify the chunk: `chunk_size`

# Iterating over data

```
import pandas as pd  
result = [] → EMPTY LIST  
WITH A LIST  
→ TAKES 1.000 ROWS PER TIME  
for chunk in pd.read_csv('data.csv', chunksize=1000):  
    result.append(sum(chunk['x']))  
total = sum(result)  
print(total)
```

4252532

# Iterating over data

```
import pandas as pd  
total = 0  
WITHOUT A LIST  
for chunk in pd.read_csv('data.csv', chunksize=1000):  
    total += sum(chunk['x'])  
print(total)
```

4252532

# **Let's practice!**

**PYTHON DATA SCIENCE TOOLBOX (PART 2)**

# Congratulations!

PYTHON DATA SCIENCE TOOLBOX (PART 2)

**Hugo Bowne-Anderson**  
Data Scientist at DataCamp

# What's next?

- List comprehensions and generators
- List comprehensions:
  - Create lists from other lists, DataFrame columns, etc.
  - Single line of code
  - More efficient than using a for loop

# **Let's practice!**

**PYTHON DATA SCIENCE TOOLBOX (PART 2)**
